Introduction

Welcome to this course of Introductory Economics. One of the main concerns of Economics is the study of efficient allocations of scarce resources (i.e., land, labor and capital) to the production of goods and services to satisfy virtually unlimited human wants. One of the main goals of economics is to identify the sources of inefficiency in the working of the economic system and the appropriate remedies. In a market system, competition could make out of greed a self-controlled mechanism that promotes the public interest resulting in efficient allocations of resources. In contrast, monopoly allows greed free rein. It leads to an inefficient allocation of resources, creates unemployment, and contributes to poverty. In addition, competition itself may fail to control greed and competitive market systems may produce an inefficient allocation of resources. These issues arise at the level of individual markets or at the micro level. Microeconomics deals with these issues. At the macro level, inefficiencies result from the lack of coordination between the present and the future needs of people and the dynamic nature of economic growth and prosperity. Money, physical assets, financial institutions, financial instruments play a major role in the economic system's attempt to solve the coordination problems. However, uncontrolled greed, inappropriate government economic policy and the dynamic operation of the market system itself can result insufficient coordination and thus inefficiencies such as those associated with unemployment, inflation, unstable interest rates and foreign exchange rates, lack of capital or chaotic technological change. The study of these inefficiencies, their causes and the role of the government in correcting those inefficiencies constitute macroeconomics, the subject matter of this course.

The purpose of this course is to introduce students to the analysis of issues related to macroeconomic policy.
